## BLUE GLASS - Glass Bead Anti-Marking film

- Glass Beaded Surface
- Durable, ink resistant
- Long-lasting, washable
- Available in Cut Sheets and Converted Jackets
- We use Heidelberg approved hardware on all Converted Jackets

Blue Glass Anti-Marking film is custom manufactured to exacting specifications to provide the very best Anti-Marking surface. The microscopic glass beads are designed to reduce the contact surface area of the freshly printed sheet to the transfer cylinder. This allows for mark-less transfer of even the most difficult coverage jobs.

The distinguishing feature of our glass bead anti-marking films is the uniquely formulated coating process that seals the glass beads to the film and provides a Super ink resistant protective coating. This not only firmly secures the glass beads but provides for easy cleaning and incredibly long life of the product. This is in comparison to other films with a soft silicone coating that wears away quickly, resulting in excessive ink buildup and short product life.

Dear Valued Customer,

Printing Research Inc., was established in 1968 for the sole purpose of researching and developing products to enhance the quality and productivity for the Printing Industry. We are proud to announce that our Product Development Team have created some exciting improvements to our Blue Glass® Product Line.

For over a year now, we have received feedback from our customers that a counterfeit Blue Glass material has been showing up in the marketplace. This material is of a substandard quality and has been mistaken as a PRI product in the marketplace. We have also received feedback from our customers that our dark blue color makes it very difficult to see “at a glance” if the jacket requires cleaning.

Due to these concerns, our team has developed a way for the market place to not only identify our product as authentic PRI Blue Glass but to also make it easier for the end user to determine the need for cleaning. The most noticeable improvement will be in the color of the product and the PRI Blue Glass Logo within the beaded glass. We have also been conducting extensive field testing on our proprietary finishing solution and the results from our R&D have shown that PRI Blue Glass now provides unmatched ink repellent properties which further reduces the need for cleaning. This increase in the duration between cleaning will in turn result in a longer product life.

We are very excited with these new improvements. We can assure you that these improvements will provide your customers with cutting edge performance and the highest quality Glass Bead Jacket technology available in the market place today.

We have samples available upon request. Should you wish to receive samples to hand out to your Sales Representatives and Customers to assist in this transition, please feel free to contact Phillip Jones @ [pjones@superblue.net](mailto:pjones@superblue.net) and he will get those out to you as soon as possible.
